

### Who we are

Founded in 2002 and headquartered in Berlin, Germany, secript GmbH specialises in solutions that ensure the authenticity, tamper resistance and confidentiality of electronic business processes.

ISO 9001 certification with annual reviews ensures that our high quality standards are maintained.

The management team has many years of management experience and comprehensive expertise in developing and marketing IT security solutions.

Our comprehensive know-how in the fields of law, Public Key Infrastructure (PKI), eBilling processes as well as relevant technologies and standards enables us to offer top-quality consultancy services.

Our solutions are always at the cutting edge thanks to our close collaboration not only with administrative bodies such as the German Federal Ministry of Finance (UStG and GDPdU Departments) and the German Federal Ministry of Economics and Technology, but also with standardisation organisations such as GS1 (formerly CCG), TeleTrust, VOI, PDF/A Competence Centre and Bitkom and with scientific institutions such as the Fraunhofer Institute.

Selected partnerships with renowned smartcard reader manufacturers, trust centres, selected system vendors and auditing companies ensure the continual integration of the latest technology while remaining legally compliant.

### What we can do for you

Taking into account the respective legislation in various countries (e.g. German Digital Signature Act, German Value Added Tax Act, GDPdU, GoBS), we offer comprehensive software solutions, consultancy services and standard products across the EU for deploying legally compliant electronic signatures, official time stamp services as well as encryption and smartcard technology in order to conduct electronic business processes more securely, efficiently, quickly and therefore more economically.

#### Some solutions

##### eBilling:

Electronic invoicing in accordance with Article 14 of the German Value Added Tax Act

##### Healthcare:

e.g. Signing medical reports and laboratory test results

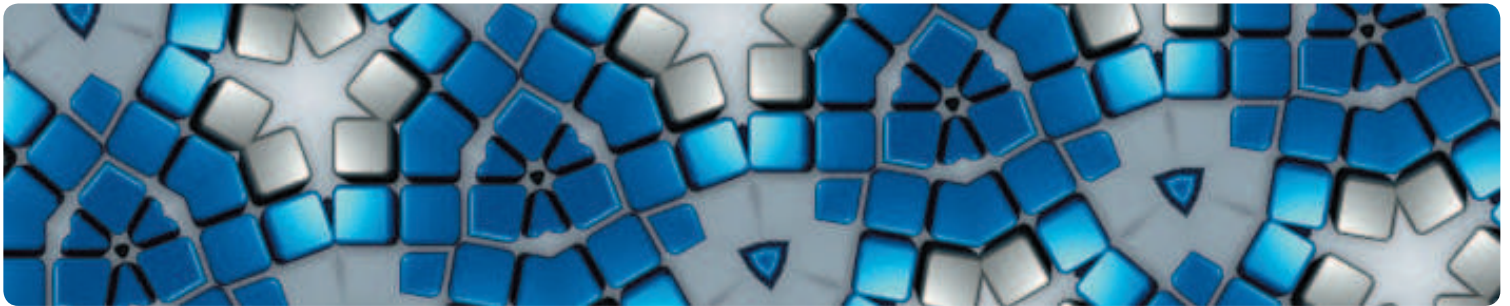

##### Communication for administrative and judicial bodies:

e.g. Transferring legally binding electronic files using the electronic signature

##### Scanning and signing:

Dispensing with paper archives, e.g. in the field of national insurance according to § 36 SRVwV

**Long-term archiving** of electronically signed files

### Standard products

The digiSeal® family of client and server-based software products supports the entire signature lifecycle, starting from the generation of the signature in all relevant signature formats to the signature verification and archiving.

Combining the electronic signature with 2D barcode technology enables, for example, the established and proven digiSeal® server signature solution to be used not just for generating signatures for all kinds of data sets (e.g. EDI, XML, PDF) but also for the VAT-relevant signing of computer fax invoices as specified by the German Federal Ministry of Finance at the beginning of 2004.

### Individual project development:

#### Complete command

#### Control over the details

Knowledge and experience gained over many years provide the basis for our professional project work tailored-made to the needs of individual customers.

While we of course seek to maintain an overview and control of what are often large and complex projects, we are also fully aware that detailed technical and legal knowledge is absolutely essential (there are many legal implications concerning electronic signatures) if the projects are to be brought to a successful conclusion.

We offer client-specific, project-related software development in the fields of electronic signatures, PKI, smartcards and document workflow.

We would be pleased to support you in implementing your complex projects.

**Optimize your potential now with solutions from a secure source.**

Thanks to diverse integrations in European-wide partner products, e.g. Unified Messaging Server, as well as partner services, e.g. ASP for eBilling, digiSeal products are easily accessible to many companies as easily integrated in-house or outsourcing solutions.

Workflows with media interface: The powerful 2D barcode makes it possible to transfer larger volumes of data with or without signatures directly to paper documents, thus supporting document workflows dependent on the media interface between paper and electronic information.

The solutions, technologies and digiSeal® products are used nationally and internationally, e.g. in the manufacturing, trade, finance and insurance sectors, in publishing, healthcare and public administration, as well as in the telecommunications and IT industries.
